                                                                                                Research
                                                                                                    for Genome
                                                                                                                                                                                                                                                                                                                                            arbitrary. Low-pass sequence sampling is useful for identifying clones that may be gene-rich and allows overlap relationships among clones to be deduced. However, it should not be assumed that this clone will be sequenced to completion. In the event that the record is updated, the accession number will
                 All repeats were identified using RepeatMasker:

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     NOTE: Estimated insert size may differ from sequence length (see http://www.hgsc.bcm.tunc.edu/docs/Genbank_draft_data.html).
NOTE: This is a 'working draft' sequence. It currently consists of 2 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as Tuns of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                       Worley, K.C.

* NOTE: This is a 'working draft' sequence. It currently consists of 48 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N. but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                op ...

NOTE: This is a 'working draft' sequence. It currently consists of 62 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.

On Sep 11, 2001 this sequence version replaced gi:15022347.

On Sep 11, 2001 this sequence version replaced gi:15022347.

Nhere differences are found these are annotated as variations

Where differences are found these are annotated as variations

together with a note of the overlapping clone name. Note that the

corresponding to the overlapping clone name. Note that the

variation annotation may not be found in the sequences submission

variation annotation may not be found in the sequences with

only a small overlap as described above.

This sequence was finished as follows unless otherwise noted: all

regions were either double-stranded or sequenced with an alternate

chemistry or covered by high quality data (1.e., phred quality >=

chemistry or covered by high quality data (1.e., phred quality >=

chemistry or covered by high quality data (1.e., phred quality >=

chemistry or covered by high quality data (1.e., phred quality >=

chemistry or covered by high quality abort covered by at least

one plasmid subclone or more than one M13 subclone; and the

assembly was confirmed by restriction digest. The following
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          AL596177 91084 bp DNA linear PRI 08-SEP-2001

                                                                                                                                                                                                                                                                                                                                                                                                                                       * NOTE: This record contains 139 individual
* Sequencing reads that have not been assembled into
* contiger. Runs of N are used to separate the reads
* and the order in which they appear is completely
* arbitrary. Low pass sequence sampling is useful for
identifying clones that may be gene-rich and allows
* overlap relationships among clones to be deduced.
* However, it should not be assumed that this clone
* will be sequenced to completion. In the event that
the record is updated, the accession number will

Submitted (07-MAR-2002) Human Genome Sequencing Center, Department of Molecular and Human Genetics, Baylor College of Medicine, One Of Molecular and Human Genetics, Baylor College of Medicine, One Of Molecular and Human Genetics, Baylor College of Medicine, One Of Molecular and Human Genetics, College of Medicine, One On Apr 27, 2000 this sequence version replaced gi:7025656.  INFORMATION: http://www.hgsc.bcm.tmc.edu/ or email	~ ~ ~ ~ ~	Total mapping efforts.  Repeats are identified using RepeatMasker (A. Smit and P. Green, unpublished.) for Human and Mouse sequences.  Genes and Region of sequence similarity are identified by BLAST (Nuc. Acids Res. 25:3389-3402) similarity (expect < 18-34) to the EST and CDNA sequences. Genes demonstrate at least two exons flanked by consensus splice sites that maintained sequence continuity across the splice junctions. Sequences that are not identical matches are annotated as similar.	SEQUENCING READ COVERAGE:Sequencing is completed to a minimum standard of double strand coverage with a minimum of 2 clones and 2 reads with no ambiguities or 2 chemistries with a minimum of 2 clones and 3 reads with no ambiguities. If the sequence quality for a region does not meet this standard, it will be indicated in the annotation as Low Coverage.	QUALLIY OF INIVIDIAL BASES: This sequence meets stringent quality atandards - estimated error rate less than 1 per 10;000 bases. Reports of lowest quality individual bases and measures of base quality are listed below. Description of the metrics can be found at URL: http://gc.bcm.tmc.edu:8088/quality.info/genbank.annotation. * NOTE: This is a 'working daft' sequence. It currently
* consists of 4 contigs. Gaps between the contigs
* are represented as runs of N. The order of the piaces
* is believed to be correct as given, however the sizes
* of the gaps between them are based on estimates that have
* provided by the submittor.

It currently consists of 17 contigs. The true order of the pieces is not known and their order in this sequence record is arbitrary. Gaps between the contigs are represented as runs of N, but the exact sizes of the gaps are unknown. This record will be updated with the finished sequence as soon as it is available and the accession number will be preserved.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Insert size: 181000; agarose-fp

PCR primers AAZ36159-60 were used to amplify a cancer associated antigen gene designated XCC-3. The specification also describes a cancer gene designated ACC-3. The specification also describes a cancer associated antigen designated CT7. The CT7 polymucleotide was isolated from SK-MEL-37 melanoma cells. The polymucleotide has some homology with from SK-MEL-37 melanoma cells. The polymetide has some homology with the protein has a repetitive pattern, with repeats rich in terminal of the protein has a repetitive pattern, with repeats rich in terminal of the protein, and ending a repetitive pattern, with repeats rich in the peptide given in AAY43877. The CT7 polypetide can be processed to the peptides which provoke lysis by cytolytic T cells. The polymucleotides peptides which provoke lysis by cytolytic T cells. The polymucleotides and polypeptides can be used for treating a cancerous condition and a cancer associated attigens can be used as an immunogenic or vaccine composition with an attigens can be used as an immunogenic or vaccine composition with an adjuvant, e.g. a cytokine, a saponin, or granulocyte macrophage-colony cadjuvant, e.g. a cytokine, a saponin, or granulocyte macrophage-colony
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 present invention describes a library of polymucleotides comprising mucleotide sequences (given in AAH10067 to AAH11145). Also described (1) an isolated polymucleotide (1) having at least 90% identity to
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human colon cancer cell line Km12L4-A cDNA library derived sequence #945.

The invention relates to isolated polynucleotide (I) and polypeptide (II) sequences. (I) is useful as hybridisation probes, polymerase chain reaction (PCR) primers, oligomers, and for chromosome and gene mapping, and in recombinant production of (II). The and gene mapping, and in recombinant production of terrape seq sequence tags polymucleotides are also used in diagnostics as expressed sequence tags for identifying expressed genes. (I) is useful in gene therapy techniques for reacte normal activity of (II) or to treat disease states involving (II). II) is useful for generating antibodies against it, detecting or quantitating a polypeptide in tissue, as molecular weight markers and as
                                                                                                                                                                                                                                                                                                                                                                                         ö
            one of the 1079 sequences; (2) a recombinant host cell containing (17); (4) an inclated polypeptide (II) encoded by (I); (4) an antibody that specifically binds to (II); (5) a vector comprising (I); and (6) a method of detecting differentially expressed genes correlated with a cancerous state of a mammalian cell comprising detecting a gene product encoded by state of a mammalian cell comprising detecting a gene product encoded by of the 1079 sequences given in the specification. The polymucleotides are used to monitor patients having (or susceptible) to cancer to detect potentially malignant events at a molecular level before they are potentially malignant events at a molecular level before they are petectable at a gross morphological level. The polymucleotides are also useful for monitoring the efficacy of various therapies and preventive useful for chromosome mapping and detection of transcription levels. The 1079 polymucleotide sequences were derived from a human colon cancer cell line Km12L4-A cDNA library.
(2) a recombinant host cell containing (I);

a food supplement. (II) and its binding partners are useful in medical limaging of sites expressing (II). (I) and (II) are useful for treating disorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in responsible for genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and disposetic coding sequences of the invention.

Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO at fib. wipo.int/pub/published_pot_sequences.
                                                                                                                                                                                                                                                                                                                                       Sequence 2010 BP; 565 A; 552 C; 532 G; 361 T; 0 other;

Nucleotides representing cancer-associated genes, used to develop products for the diagnosis, monitoring and treatment of cancers

Claim 55; Page 42-43; 44pp; English.

The present sequence represents an alternative form of a cancer associated antigen gene designated KOC-3. The specification also describes a cancer associated antigen designated CT7. The CT7 describes a cancer associated artigen designated CT7. The CT7 polynciactide was isolated from SK-MSL-37 melanoma calls. The Colyneptide has some homology with MAGB-10, limited to about 210 carboxy cerminal amino acids. The amino terminal of the protein has a repetitive pattern, with repeats rich in serine, proline, glutamine and leucine, and an almost invariable core of the peptide given in AAY43877. The CT7 polypeptide can be processed to peptides and polypeptides can be used for treating a cancerous condition and screening for or diagnosing cancerous conditions. The cancer associated antigens can be used as an immunogenic or vaccine composition with an adjuvant, e.g. a cytokine, a saponin, or

The specification also describes a cancer associated antigen designated Trom SK-MEL-37 melanoma cells. The CT7 polymucleotide was isolated from SK-MEL-37 melanoma cells. The polypeptide has some homology with terminal of the protein has a repetitive pattern, with repeats rich in serine, proline, glutamine and leucine, and an almost invariable core of peptide given in AAY43877. The CT7 polypeptide can be processed to peptides which provoke lysis by cytolytic T cells. The polymucleotides and polypeptides can be used for treating a cancerous condition and antigens can be used an annexe associated antigens can be used an annexe on an almost invariable core and polypeptides an an immunogenic or vaccine composition with an antigens can be used as an immunogenic or vaccine composition with an

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          -AUG-2000
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             2-AUG-2
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       0-JUN-2
     The invention relates to isolated polymucleotide (I) and colored (II) sequences. (I) is useful as hybridisation probes, collypeptide (II) sequences. (I) is useful as hybridisation probes, collymerase chain reaction (PCR) primers, oligomers, and for chromosome polymerase chain reaction (PCR) primers, oligomers, and for chromosome companies are also used in diagnostics as expressed sequence tags continuation of (II) is useful in gene therapy techniques for identifying expressed genes. (I) is useful in gene therapy techniques continuity in useful for generating antibodies against it, detecting or continuitating a polypeptide in tissue, as molecular weight markers and as a food supplement. (II) and its binding partners are useful in medical a food supplement. (II) and its binding partners are useful in medical imaging of sites expressing (II). (I) and (II) are useful for treating ciscorders involving aberrant protein expression or biological activity. The polypeptide and polymucleotide sequences have applications in the polypeptide and polymucleotide sequences have applications in the polypeptide of genetic disorders or other traits to assess biodiversity and to produce other types of data and products dependent on DNA and amino acid sequences. AAS64197-AAS94564 represent novel human and manner in the medical manner.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Note: The sequence data for this patent did not appear in the printed specification, but was obtained in electronic format directly from WIPO

The invention relates to isolated nucleic acid molecules and their coded secreted proteins. The nucleic acids and proteins are used to prevent, treat or annellorate a medical condition in e.g. humans, mice, cabbits, goats, horses, cats, dogs, chickens or sheep. They to a pathological condition. Antibodies to the proteins can also to a pathological condition. Antibodies to the proteins can also condition. Antibodies to the proteins can also compared in alleviating symptoms associated with the disorders and in diagnostic immunoassays e.g. radioimmunoassay or enzyme linked immunosophant assays (ELISA). Disorders which are diagnosed or treated include autoimmune disease e.g. rheumatoid arthitis, cardiovascular disorders e.g. rheumatoid arthitis, hyperproliferative disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. cardiac arrest, cerebrovascular disorders e.g. corneal infections caused by bacteria, viruses and fungical social cardisorders e.g. corneal infection, and many other and ocular disorders e.g. corneal infection, and many other cardisorders e.g. corneal infection, and many other and ocular disorders e.g. corneal infection, and many other corneal infection, and many other corneal infection, and many other and ocular disorders e.g. corneal infection. The polypeptides can also be used to aid wound healing and epithelial cell proliferation, to resent skin aging due to sunburn, to maintain organs before corneal and other nutritional components. The polypeptides can also be used capabilities, fat content, lipid, protein, carbohydrate, vitamins, capabilities, fat content, lipid, protein, carbohydrate, vitamins, centent encodes a novel secreted protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                New nucleic acid molecules encoding 461 human secreted proteins for diagnosing, preventing, treating or ameliorating medical conditions and used as food additives or preservatives -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Gapa
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   DNA polymerase III holoenzyme delta subunit related DNA SEQ ID NO:61.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA polymerase III holoenzyme deltá subunit; DNA polymerase III;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               The present invention describes nucleic acid sequences encoding a DNA polymerase III holoenzyme delta subunit (I) from bacteria. (I) has antibacterial; tuberculostatic; antileprotic. Methods from the present invention can be used for screening for bacterial DNA polymerase holoenzyme delta subunit proteins and agents that modulate their activity. The agents are useful in the treatment of bacterial activity. The agents are useful in the treatment of bacterial wyersinia, Corynebacterium, Salmonella, Mycobacterium tuberculosis or M. leprae. The invention provides a convenient means of identifying compounds which modulate DNA replication in bacteria and therefore provide antibacterial targets, and which are also useful for amplification of DNA. ABL89335 to ABL88071 and ABB84724 to ABB84816 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Nucleic acid encoding a DNA polymerase III holoenzyme delta subunit from bacteria, useful for screening agents that modulate the subunit activity which is useful in the treatment of bacterial infections e.g.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         DNA polymerase III holoenzyme delta subunit related DNA SEQ ID NO:62
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      DNA polymerase III holoenzyme delta subunit; DNA polymerase III; DnaX; holA; holB; antibacterial; tuberculostatic; antileprotic; bacterial infection; DNA replication modulation; gene; ds.

The present invention describes nucleic acid sequences encoding a DNA polymerase III holoenzyme delta subunit (I) from bacteria. (I) has antibacterial; tuberculostatic; antileprotic. Methods from the present invention can be used for screening for bacterial DNA polymerase holoenzyme delta subunit proteins and agents that modulate their activity. The agents are useful in the treatment of bacterial affections e.g. S. progenes, S. aureus S. pneumoniae, Mycoplasma, infections e.g. S. progenes, S. aureus S. pneumoniae, Mycoplasma, versinia, Corynebacterium, Salmonella, Mycobacterium tuberculosis or M. leprae. The invention provides a convenient means of identifying compounds which modulate DNA replication in bacteria and therefore provide antibacterial targets, and which are also useful for amplification of DNA. ABL887935 to ABL88071 and ABB84724 to ABB84816 represent sequences used in the exemplification of the present
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          DNA polymerase III holoenzyme delta subunit related DNA SEQ ID NO:64.
                                                                                                                                                             Nucleic acid encoding a DNA polymerase III holoenzyme delta subunit from bacteria, useful for screening agents that modulate the subunit activity which is useful in the treatment of bacterial infections e.g. S. pyogenes and S. aureus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           DNA polymerase III holoenzyme delta subunit; DNA polymerase III; bnaX; holA; holB; antibacterial; tuberculostatic; antileprotic; bacterial infection; DNA replication modulation; gene; ds.

The present invention describes nucleic acid sequences encoding a DNA polymerase III holoenzyme delta subunit (I) from bacteria. (I) has antibacterial; tuberculostatic; antileprotic. Methods from the present invention can be used for screening for bacterial DNA polymerase holoenzyme delta subunit proteins and agents that modulate their activity. The agents are useful in the treatment of bacterial infections e.g. S. pyogenes, S. aureus, S. pneumoniae, Mycoplasma, Yersinia, Corynebacterium, Salmonella, Mycobacterium tuberculosis or Compounds which modulate DNA replication in bacteria and therefore provide antibacterial targets, and which are also useful for amplification of DNA. WPI; 2002-164785/21. P-PSDB; ABB84745 Nucleic acid encoding a DNA polymerase III holoenzyme delta subunit from bacteria, useful for screening agents that modulate the subunit activity which is useful in the treatment of bacterial infections e.g. S. pyogenes and S. aureus

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82214 represent specifically claimed Neisseria meningitidis genomic DNA sequences; AAA81260 to AAA81303 and AAB25620 to AAB25653 represent Neisseria DNA sequences and their corresponding proteins; AAA81254 to AAA81259 and AAA81321 represent PCR primers used in the

Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea -

isolation of Neisseria meningitidis DNA sequences; and AAA81322 to
AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF
CC AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF
CC sequences, which are all used in the exemplification of the present
CC invention. The nucleic acid sequences, protein sequences, and antibodies
composition can be used in the manufacture of a composition. The
composition can be used as a medicament (or in the manufacture of a
composition. The composition can be used as medicament (or in the manufacture of a
composition. The composition of sequences we seemed to against all serotypes;
cc medicaments of vaccines against Meningococcus B; against all serotypes;
cc and/or against all pathogenic Neissariae. Identification of sequences
cc and/or against all pathogenic Neissariae. Identification of sequences
cc and/or against all pathogenic Neissariae. Identification of sequences
cc medicamenty organism-specific probes. Attempts to make efficacious
particularly organism-specific probes. Attempts to make efficacious
cc multivalent vaccines have also been tried but none have successfully
covercome antigenic variability. The provision of further, complete
cc sequences may provide an opportunity to identify secreted or surface
cc exposed proteins that may be presumed targets for the immune system and
which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                     ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Tettelin H, Venter JC;

Isolated nucleotide sequences of Neisseria meningitidis which can be used in the diagnosis and treatment of N. meningitidis infection and other Neisserial infections, for example, N.gonorrhoea

The present invention describes methods of obtaining immunogenic proteins from Neisseria genomic sequences. AAA81453 to AAA82414 represent specifically claimed Neisseria meningitidis genomic DNA

Claim 7; Page 353-383; 1760pp; English.

```
Sequences, AAA81260 to AAA81303 and AAB25620 to AAB25663 represent CC Neisseria DNA sequences and their corresponding proteins, AAA81254 to AAA81259 and AAA81321 represent PCP primers used in the isolation of Neisseria meningitidis DNA sequences, and AAA8132 to AAA81322 represent Neisseria meningitidis MenB polynucleotide ORF AAA81452 represent Neisseria meningitidis MenB polynucleotide ORF composition. The nucleic acid sequences, protein sequences, and antibodies invention. The nucleic acid sequences, protein sequences, and antibodies composition can be used in the manufacture of a composition of the present composition can be used in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a composition can be used as a medicament (or in the manufacture of a components of vaccines against Meningococcus B, against all serotypes; be components of vaccines against Meningococcus B, against all serotypes; components of vaccines against All pathogenic Neissariae. Identification of sequences conforted particularly organism-specific probes. Attempts to make efficacious particularly organism-specific probes. Attempts to make efficacious conserved proteins have also been tried but none have successfully overcome antigenic variability The provision of further, complete exposed proteins that may be presumed targets for the immune system and which are not antigenically variable or at least more conserved than
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ö
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Masignani V.

Claim 7; Appendix A; 692pp; English.

The present invention describes the full length genome of
Neisseria meningitidis B (NMB). The sequences in AAP21544 and AAF21607
To AAP21613 represent fragments of the NMB genomic sequence, as the
sequence was too long to go in a record on its own it was split into 8
sequences which overlap each other at the beginning and end of each
sequence by 49980 bp (1.e. the last 49980 bp of AAF21544 is repeated at
the beginning of AAF21609, and so on). AAF21545 to AAF21589 encode the
consistent a proteins given in AAF35850 to AAF31589 encode the
consistent a proteins given in AAF35850 to AAF31589 to
the present invention. The NMB genome and fragments from it have
contibacterial activity, and can be used in the exemplification of
antibacterial activity, and can be used in vaccines and gene therapy.
Contibacterial compositions for treating or preventing infection
contibacterial bacteria or as a diagnostic reagent for detecting the
presence of Neisserial bacteria or of antibodies raised to Neisserial
contibacteria. Computers, computer memory, computer storage medium or computer
contibacteria. Computers of an as a diagnostic reagent for detecting the
contibacteria. Computers computer memory, computer storage medium or computer
contibacteria. Computers within the NMB genome. The DNA sequences provide
cor coding sequences within the NMB genome. The DNA sequences provide
contibacterial reads.
Contibacterial pacterial or of antibacterial and contibacterial activity of the contibacterial activity.
Contibacterial computers within the NMB genome contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the contibacterial activity of the \$

Neisseria meningitidis B full length genome sequence and open reading frames are used to detect, treat and prevent Neisserial infections -

The Purchason describes the full tengen genome or Neisseria meningitidis B (NMB). The sequences in AAF21644 and AAF21607 to AAF21613 represent fragments of the NMB genomic sequence, as the sequence was too long to go in a record on its own it was split into 8 sequences which overlap each other at the beginning and end of each sequence by 49980 bp (i.e. the last 49980 bp of AAF2164 is repeated at sequence by 49980 bp (i.e. the last 49980 bp of AAF2164 is repeated at the beginning of AAF21607, the last 49980 bp of AAF21607 are repeated to the beginning of AAF21608, and 80 on). AAF2165 to AAF21689 and code the Neisseria proteins given in AAB5850 to AAB58593, and AAF21589 to AAF21606 represent PCR primers which are used in the exemplification of the present invention. The NMB genome and fragments from it have antibacterial activity, and can be used in vaccines and gene therapy.

Neisseria nucleic acids, proteins and/or antibodies which binds to the presence of Neisserial bacteria or as a diagnostic reagent for deceting the computer. Computers, computer memory, computer storage medium or computer databases can be used in a search to identify open reading frames (ORFs) or coding sequences within the NMB genome. The DNA sequences provide comportunities to find antigenic or immunogenic proteins which are near an effective in vaccines than the outer membrane proteins currently present invention describes the full length genome of
